A look to the future

A LOOK TO THE FUTURE

More than
48 Years of Reliability

History

The PACKMAN Company was established in February of 1975. This company started its official activity in the field of construction of High-Pressure Vessels such as Hot-Water Boilers, Steam Boilers, Pool Coil Tanks, Softeners and Heat Exchangers from 1984. As the first supplier of Hot water boilers with high quality and standard mark, PACKMAN has started exporting its products to countries such as Uzbekistan, United Arab Emirates and other countries in the region. Currently, PACKMAN honor-fully is one of the largest producers of hot-water and steam boilers in the Middle East. After 40 years of experience in the field of heating industry, especially boilers and burners, this group started his activity on January 2011 in the area of burners with brand of raadman. The main objective of this group was improvement and development of industrial burners in order to produce high quality and highly efficient industrial burners with optimum operation in the Middle East. Based on technical knowledge and engineering design of industrial burners, PACKMAN Corporation started the production of low, medium and big sized industrial burners. By the efforts of engineers of R&D department, the burner's combustion improved significantly and as a consequence, the production of burners developed rapidly. Gas, Light oil (LFO), Heavy oil (HFO) and dual/triple fuel burners with different firing ranges were produced and tested successfully.

Nowadays, the burners of this company cover a firing range of 100 to 60000 kW. Single stage, double stage, modular and Low NOx burners (generally lower than 80 mg/kWh and individually lower than 40 mg/kWh) are available for various domestic and industrial applications. High quality, optimum operation and customer satisfaction has always been considered in the production of raadman burners. Diversity and high quality of raadman burners, besides their easy installation and maintenance make them a perfect selection for many customers.

Product Family Name: RAADMAN

Firing ranges

Gas burners (RGB Series):

Dual Fuel burners (RLGB Series):

Staging mono block raadman burner

raadman Staging burners cover a firing range from 160 kW to 6200 kW in II or III stage Natural gas and light fuel oil. These burners, with high-quality electro/mechanical accessories with easy installation, commissioning and maintenance, are economically designed for city or industrial applications such as three pass hot water boilers, steam boilers, hot air generator etc.

Two or three stage burners, following the temperature/steam load requested by the system, allow operating at full (or medium) and reduced output, with consequent reduction in turning the burner on and off, that gives better performances to the boiler. Since the burner's air damper is independently controlled by an electric servomotor, during stand-by, the air entrances are getting completely closed and prevents heat loss due to the flue natural draught.

One of the most highlighted privileges of Raadman-Staging, is the lack of mechanical link between gas butterfly valve and air damper. In other word, air damper is controlled with an independent two or three stepping actuators. At the same time, gas (or light oil) is controlled with two or three parallel solenoid valves, resulting an ability of precise control and adjustment on each of burner stages. This helps a superior and complete combustion.

CFD experts in R&D department

Industry relies on heat from the burners in all combustion systems. Optimizing burner performance is critical to complying with stringent emissions requirements and to improve industrial productivity. Engineers involved in designing and building advanced combustion equipment for the hydrocarbon process industries routinely use Advanced CFD to advance new burner technology. The science and technology of CFD has matured to the point where performance predictions are made with a degree of confidence from models covering a wide range of complex furnace, burner, and reactor geometries.

While tremendous advances have been made in understanding the fundamentals of combustion, the remaining challenges are complex. To make improvements, it is critical to understand the dynamics of the fuel fluid flow and the flame and its characteristics. Computational Fluid Dynamics offers a numerical modeling methodology that helps in this regard. Commercial CFD codes utilize a standard approach to simulate chemical kinetics, which approximate the consumption and production of chemical species. This causes the engineer to use simplifying assumptions about the chemistry considered in the simulation. CFD can help engineers to optimize flow through orifices, blades and swirlers to achieve a homogenous mixture of air and gas.

Specification

Fuels

- Natural gas
- Light oil (viscosity < 6 cSt)
- Other types of fuels (such as heavy oil, LPG etc.) requires written confirmation from burner department of packman corporation (raadman brand).

Applications

Raadman gas and dual fuel burners are suitable for the following utilizations.

- Installation on heat exchanger
- Hot water boiler
- Steam boiler and high-pressure hot water boiler
- Hot air generator
- Compatible with all types of combustion chambers according to EN303 standard.

Technical & Functional Features

Light weight and optimized geometry.

High quality heat resistant steel material for the all parts of burner head as well as flame covering accessories.

Mono-bloc design and fully enclosed aluminum air housing. Simple Installation, adjustment and maintenance.

Easy access to internal components.

Engineered for maximize efficiency and fuel cost savings.

Suitable for firetube, firebox and water tube boilers

Equipped with high quality and reliable electronic devices.

Up to 10-20 % flame shape control

High quality staging controllers from well-known producers.

Standard compliance

Designed in accordance with ISIRI-7595 and ISIRI-7594 Iran national standard (equal to the BS-EN676, BS-EN267 European standards)

Control

The following methods of regulation are available for Raadman-Staging (Mono-Bloc) burners:

Gas/oil: Two or Three stages operation

Permissible ambient conditions:

- Ambient temperature
- -10 to +40 °C (14 to 104F)
- -15 to +40 °C (5 to 104F)

Air humidity: max. 80 % relative humidity, no condensation.

The combustion air must be free of aggressive substances (halogens, chlorides, etc.) and impurities (dust, debris, vapors, etc.)

Emission:

The emissions have been measured in various models at the maximum output, according to DIN-EN 676 and DIN-EN 297 standard.

The values of CO and NOx during burner operation are lower than 30 and 120 mg/kWh at 20 % excess of air for normal versions and, lower than 20 and 80 mg/kWh for Low NOx versions (LN series). consequently, the burner's NOx class of II and III is reported and being approved for normal version and LN Versions respectively.

Special notes:

LN versions have a higher rate of mixing during their operation. This results a further decrease in the flame length and an increase in the flame diameter.

Flame dimension

The flame dimensions which play an effective role in the burner efficiency and influence their compatibility to the boiler combustion chamber geometry, are presented in the above diagram.

Suggested combustion chamber dimension:

The raadman burners can be appropriately selected for all boilers which are designed according to the BS-2790, BS-855, EN-303, BS-EN 12953-3. It is recommended that a flame fill 90% of combustion chambers at its maximum output.

Note:

According to the BS-EN 676, valve proving system shall be used in burners with capacity above 1.2 MW. Consequently, MADAS-MTC10 or DungsVDK200 valve proving system are highly recommended.

Layout of the valve train

On boilers with hinged doors, the valve train must be mounted on the opposite side to the boiler door hinges.

Break points in the valve train

Break points in the valve train should be provided to enable the door of the heat generator to be swung open. The main gas line is best separated at the compensator.

Support of the valve train

The valve train should be properly supported in accordance with the site conditions. See the radman accessories list for various valve train support components.

*Butterfly Valve: In raadman-Staging version, since there is no link between air and gas inlets, no butterfly valve is used. As a result, its relative pressure drop is considered to zero.

**Combustion Head

*** Due to the uncommon type of this gas train (GT6), the Mechanical Staging operation type is more favorable for this firing rate of burners.

Calculation of minimum inlet pressure and minimum output pressure of regulator

$$\text{Min input pressure} = \Delta P_{\text{Filter(F)}} + \Delta P_{\text{Regulator(R)}} + \Delta P_{\text{Safety solenoid valve(sv1)}} + \Delta P_{\text{Main solenoid valve(sv2)}} + \Delta P_{\text{Butterfly valve(B.V)}} + \Delta P_{\text{Combustion Head(C.H)}} + \Delta P_{\text{Combustion chamber(C.C)}}$$

$$\text{Min output pressure of regulator} = \Delta P_{\text{Safety solenoid valve(sv1)}} + \Delta P_{\text{Main solenoid valve(sv2)}} + \Delta P_{\text{Butterfly valve(B.V)}} + \Delta P_{\text{Combustion Head(C.H)}} + \Delta P_{\text{Combustion chamber(C.C)}}$$

Oil delivery system

Two stages dual-fuel burner

Three stages dual-fuel burner

MV: Fan motor
MP: Pump motor
FS: Flame sensor
VD: Light oil safety valve

VD1: Light oil delivery valve Stage 1
VD2: Light oil delivery valve Stage 2
VD2: Light oil delivery valve Stage
TA: ignition transformer

C: Coupling
G: Gauge
F: Gas or oil flame
ASV: Air damper servomotor
PA: Air pressure switch

Emission

raadman Staging (mono-block) Burners cover a firing range of 160 up to 6,200 kW generally. They can be used wherever heat is needed in heating residences or hospitals, schools or offices, in industry or trade, on board ships and for mobile plant. They are suitable for all commonly available gas and oil types and are notable for their superior reliability, longevity, great economy and ease of manganese.
